Building X

I'm a UX Strategist and Product Owner with a consulting background, shaping digital products and services for complex, fast-evolving industries, including B2B and Software as a service projects.

Working across startups, corporates, and growing businesses has taught me to connect user needs, business vision, and technical complexity, turning strategic challenges into intuitive, high-impact experiences.

Civic™ E2E Product Re-Design

A mission-critical platform, evolved over 25 years, for sanctions management.

ROLE
SERVICE DESIGNER & PRODUCT OWNER

SECTOR
PUBLIC SECTOR · GOVTECH

YEAR
2025

HQ
MILANO / CATANIA (IT)

CONTEXT

Civic is software designed to manage the entire life cycle of ends and ends. The software was developed 25 years ago and has been updated over time to comply with highway code regulations. **A local police department, through Civic, can manage the entire station,** its staff, fines, payments, photographic evidence, document management and API integrations with external services.

A selection of the previous search field masks.

Different UI templates on different screens, with different buttons, activating similar functions.

Aligning teams, stakeholders and product vision.

ROLE

Within the client team, I held the role of **Product/Service Designer and Product Owner**. I am part of a consulting team together with a front-end developer and a back-end developer. Furthermore, in the client team, there were some developers and subject matter experts, whom I coordinated for the definition of the product roadmap.

I managed the backlog, assigned tasks, aligned internal and external stakeholders, and proposed activities through pre-sale activities and alignment of expectations.

I independently managed the relationships with the entire client team and with all the interested parties involved, including the owner of the client company.

CHALLENGES

- The complexity of the software, in continuous development for 25 years, is enormous. Modules range from personnel and fine management to payment management, photographic evidence, documents and API integrations with external services. There are over 700 search fields alone, spread across 45 screens and 13 modules;
- **The design was not coherent nor consistent:** features were added over time without a unified design guideline, resulting in inconsistent behavior and patterns;
- Lack of documentation: there was no developer documentation, no user manuals, and the project lacked. a proactive roadmap. **Each stakeholder had their own vision** of the future of the product;
- Positive feedback from users: despite some limitations, such as the lack of a cloud version, users were satisfied with the product features, **which made the need for a redesign less urgent**;
- Limited UX skills: the client team lacked the necessary UX knowledge, requiring parallel training to enable autonomous decision-making for future. updates;
- Time constraints: The initial three-month timeline required prioritizing key elements, such as information architecture, to ensure developers could proceed **efficiently and autonomously**.

Blueprint e journey

1- Gestione ruoli e permessi

Descrizione
Flusso di gestione dei permessi delle utenti della struttura della journey e pagina di gestione utenti.

Contenuti
Contenuti descritti a lato sono comuni a tutti i widget:
- Filtri attivi (2), la paginazione (5) e le funzioni contestuali (6) sono presenti solo laddove richiesti, mentre il nome del widget e i comandi sono presenti sempre.
- Particolare attenzione viene rivolta al bottoni dei comandi (3), in quanto permettono il riposizionamento e la chiusura del pannello.

Composizione
La composizione del singolo elemento è uguale per tutti i livelli possibili, ovvero:
- Icona di angle-right, che diventa angle-down nel caso di voce esplosa
- Icona specifica del modulo o della feature
- voce del menu

Documentazione componenti → widget generico

Descrizione
Il widget è la trasposizione nella nuova versione delle finestre di Civic on premise. La struttura a moduli autonomi e comunicanti rimane in vigore ma le istanze si presentano come blocchi di contenuto

Contenuti
I sei elementi descritti a lato sono comuni a tutti i widget. I filtri attivi (2), la paginazione (5) e le funzioni contestuali (6) sono presenti solo laddove richiesti, mentre il nome del widget e i comandi sono presenti sempre. Particolare attenzione viene rivolta ai bottoni dei comandi (3), in quanto permettono il riposizionamento e la chiusura del pannello.

Composizione
La composizione del singolo elemento è uguale per tutti i livelli possibili, ovvero:

Mapping Product Complexity.

ACTIVITIES

As a Product Designer, I managed the entire end2end design process:

1. ANALYSIS

- Mapped the client stakeholders’ desired outcomes, roadmaps, and concerns;
- Created and ran a research plan;
- Conducted workshops with operators to map the current user experience of those who work daily with Civic;
- Conducted over 40 hours of interviews with expert client users to understand business logic, highway code elements, and dynamics, and to map the service with a blueprint;
- Independently studied the software and mapped all elements, patterns, internal standards, and conventions present in the platform;

Diagram and data model for a specific journey (role assignment) and UX improvements mapping, and an example of component documentation (maintenance user manual).

From Research to Strategy.

2. DESIGN

- Proposed key templates that encapsulated the most common patterns and could function as "building blocks," allowing the migration of functions from the old product to be as simple as selecting the appropriate pattern and using it for new screens;
- Translated Civic's industry-specific conventions into a browser-oriented language, ensuring accessibility and up-to-date design patterns while staying close to the current product;
- Defined a design system by adapting the PrimeNG library to the client's tone of voice and coordinated branding;

3. STRATEGIC SUPPORT

- Helped define the product roadmap, providing tools, methodologies, and activities to redefine the project scope, prioritize the backlog, and establish a collaborative development framework (Scrum adapted to the team's needs);

4. CURRENT PHASE

- I am Delivering additional templates for highly specific functions to developers;
- I am Managing the roadmap and backlog item prioritization, as well as the product strategy;
- I am Overseeing alignment routines, stakeholder alignment between the client and consultants, and tracked the development team's velocity with corresponding reporting;
- Periodically review frontend development and flag bugs or discrepancies with the provided UI.

IMPACT

The modular design was successfully implemented, ensuring that pages open clean, initially displaying only the search module. The page **dynamically composes itself** by gradually adding the necessary modules (widgets) based on the user's task progress, enhancing focus and efficiency.

We also introduced the ability for users to save **personalized layouts based on their recurring activities** and roles. This allows for the creation of widget presets that instantly load the optimal interface for specific strategic tasks, significantly reducing preparation time.

Finally, **accessibility and clarity** have been maximized. Every pattern is now accompanied by a clear text label, eliminating previous ambiguous icons and ensuring that texts explicitly explain the function. This removes the need for the operator to recall or interpret functions, drastically reducing errors and the learning curve.

KEY LEARNINGS

The project is still ongoing, and I have yet to fully process all the lessons learned. However, I can say that:

- In environments without a design culture, both the content and the way it is communicated matter. Non-design professionals are not always accustomed to discuss a product they've invested 25 years in.
- Always look at the glass as half full: even if a screen is inaccessible, outdated, or poorly positioned, the business logic and operational flow might still be excellent.

Redesigned platform screens, with both minimized and opened widgets.

CONTEXT

In Siemens’ Building X, Energy Manager is a digital product for **monitoring and optimizing energy consumption** and production in complex building portfolios.

ROLE

I worked as a **Senior UX Designer**. In this role, I contributed to the end-to-end design process, from discovery and concept validation to detailed interaction design and developer handoff.

ACTIVITIES

I collaborated with project managers and product owners to define and prioritize new features. I conducted user research through interviews and surveys to identify user needs, behaviors, and pain points. I created personas, user journey maps, and empathy maps, and developed information architecture, sitemaps, and navigation flows to structure content. I designed **wireframes, low- and high-fidelity prototypes, and mockups** to visualize user flows and interfaces. I performed usability testing, gathered feedback to validate designs and uncover issues, iterated on solutions to optimize accessibility, usability, and business goals, and aligned with developers and stakeholders to ensure correct implementation.

IMPACT

Delivered and discussed component feasibility with developers, including:

- Interactive and filterable dashboards with charts.
- Various components like date pickers, filter sets, and internal standards based on shapes and colors.
- New sections, like dashboards or site manager panels.
- End to end process of features about scope 1, 2 and 3 emissions monitoring dashboard, as requested to earn iso 14067 certification.
- Ensured frontend implementation matched the delivered UI.

KEY LEARNINGS

- Do not always prioritize feasibility in design; what seems impossible is often achievable.
- Ensure you are not reinventing the wheel.
- Save some mockups of crazy concept you propose, even if they will not be accepted. Else, you will end up using the screens available online.

Some screens, publicly available, of components I worked on specifically.

Building Scalable Enterprise Experiences.

CONTEXT

Building X is a Siemens multi-product platform for the **management of smart grids and smart buildings**, mainly targeting B2B customers. It is presented in the product portfolio as a cloud-based alternative solution.

ROLE

I joined the project as **Senior UX Researcher**.

ACTIVITIES

I proposed and executed the following activities: research planning, stakeholder alignment, kickoff meetings, creation of **research plans**, conducting both field and **desktop studies**, service blueprint mapping, **qualitative and quantitative analysis**, insight synthesis, and **suggesting new initiatives**.

Understanding Global User Needs.

CHALLENGES

No previous end-to-end mapping of the onboarding flow for a building or campus had been done. I contacted and interviewed over 40 users across 3 continents (USA, Africa, Europe) in various regions, aligning stakeholders from diverse business divisions (including sales, procurement, installation, technical leaders, developers, and engineers). The process of rationalizing and mapping onboarding flows lasted between 6 months and 3 years depending on complexity, through 5 complementary personas and 25 interviews.

Various templates extracted from the report I presented to different stakeholders, including a concise, high-level executive summary.

Driving Evidence-Based Decisions.

KEY LEARNINGS

- It is a mistake to take for granted that you understand what your interviewee is reporting, it's better to **double check**. Especially for engineers with 25+ years of experience;
- **Aligning stakeholders** during the process often reveals surprises that would otherwise go unnoticed, putting audience into a defensive mode;
- A thorough **research process requires time** to design and implement but ultimately saves more time.

IMPACT

For the first time, all actors involved in the onboarding process could see how their roles fit into the **overall flow**. Pain points were grouped into 5 main clusters, each containing 6–12 issues. The **13 design questions** that emerged enabled teams to solve prioritized problems efficiently, with actions agreed upon with stakeholders from reference business departments.

Thank you!

I look forward to your thoughts and feedback.
I'd be happy to connect and continue the
conversation further,

Giorgio
