

IMPACT

The modular design was successfully implemented, ensuring that pages open clean, initially displaying only the search module. The page **dynamically composes itself** by gradually adding the necessary modules (widgets) based on the user's task progress, enhancing focus and efficiency.

We also introduced the ability for users to save **personalized layouts based on their recurring activities** and roles. This allows for the creation of widget presets that instantly load the optimal interface for specific strategic tasks, significantly reducing preparation time.

Finally, **accessibility and clarity** have been maximized. Every pattern is now accompanied by a clear text label, eliminating previous ambiguous icons and ensuring that texts explicitly explain the function. This removes the need for the operator to recall or interpret functions, drastically reducing errors and the learning curve.

KEY LEARNINGS

The project is still ongoing, and I have yet to fully process all the lessons learned. However, I can say that:

- In environments without a design culture, both the content and the way it is communicated matter. Non-design professionals are not always accustomed to discuss a product they've invested 25 years in.
- Always look at the glass as half full: even if a screen is inaccessible, outdated, or poorly positioned, the business logic and operational flow might still be excellent.

Redesigned platform screens, with both minimized and opened widgets.
